

Horseshoe crab abundance and biomass through time

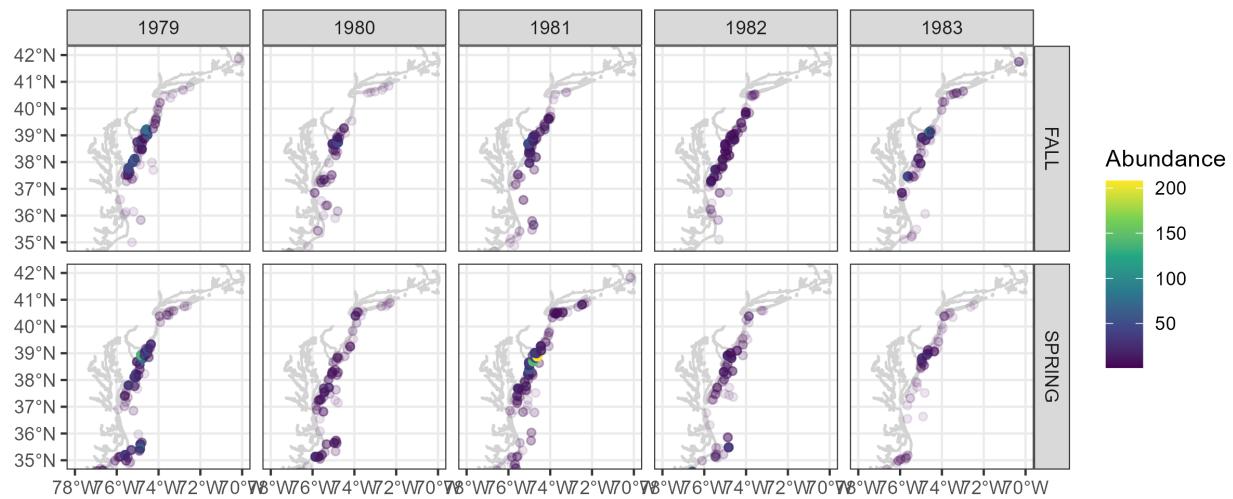

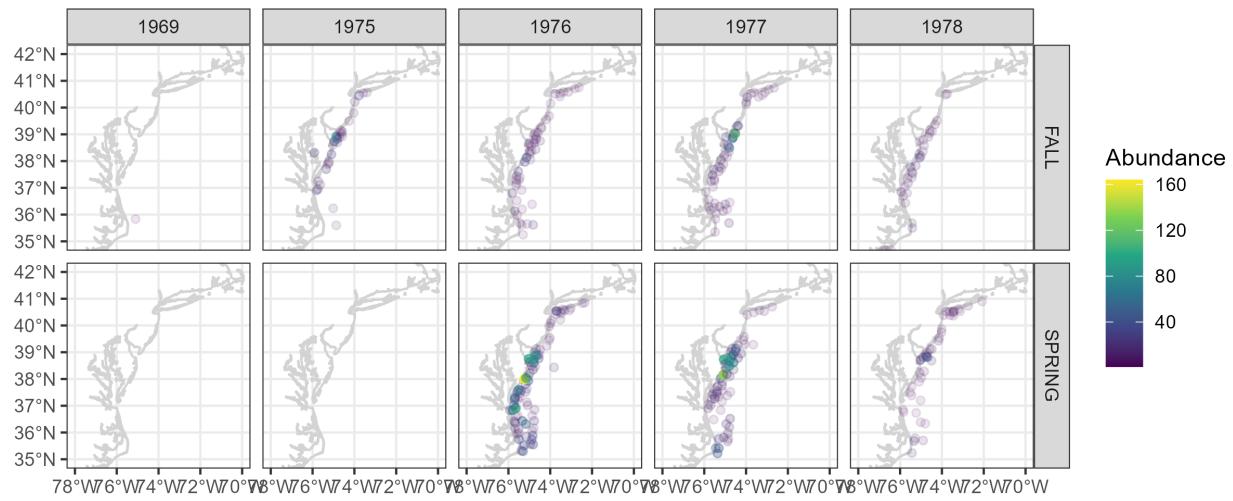

Data from the NEFSC seasonal bottom trawl surveys

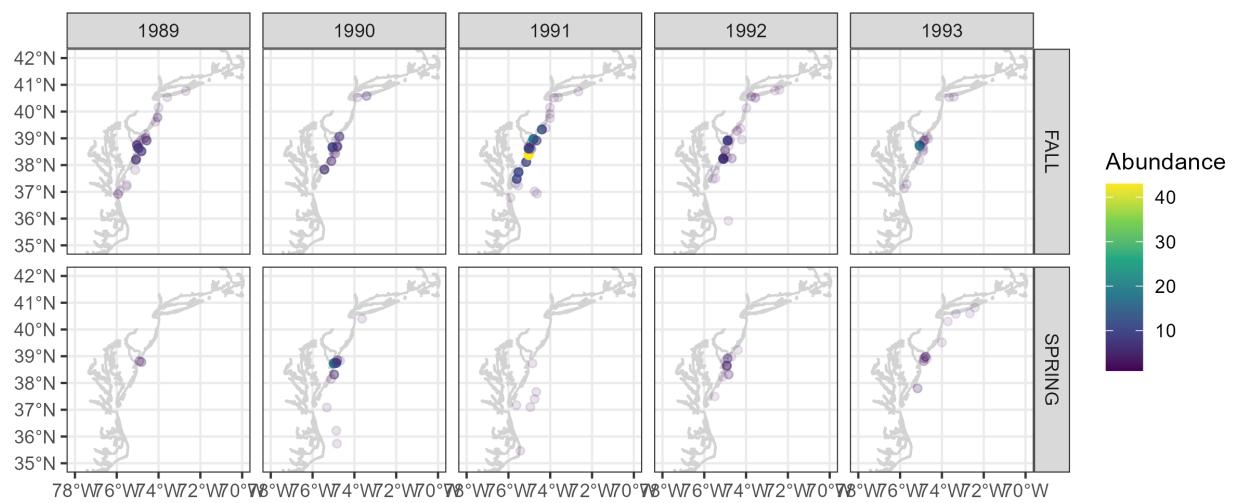

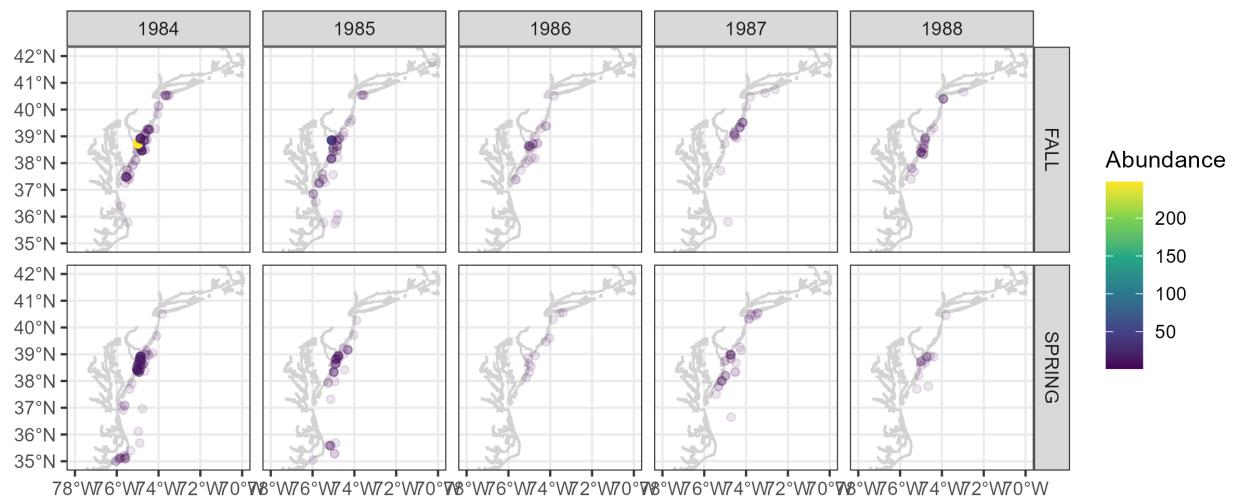

Mike O'Brien

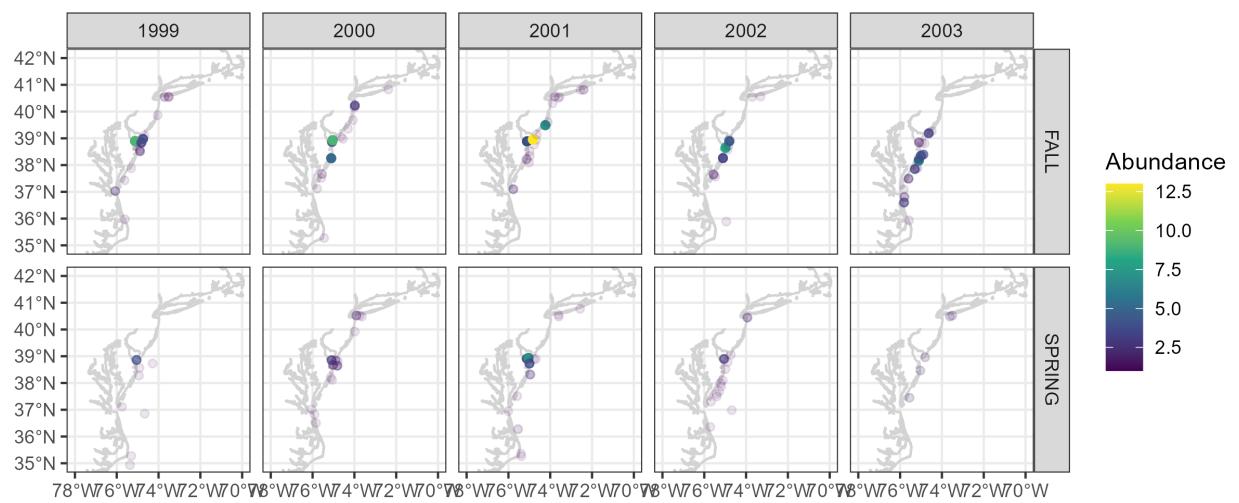

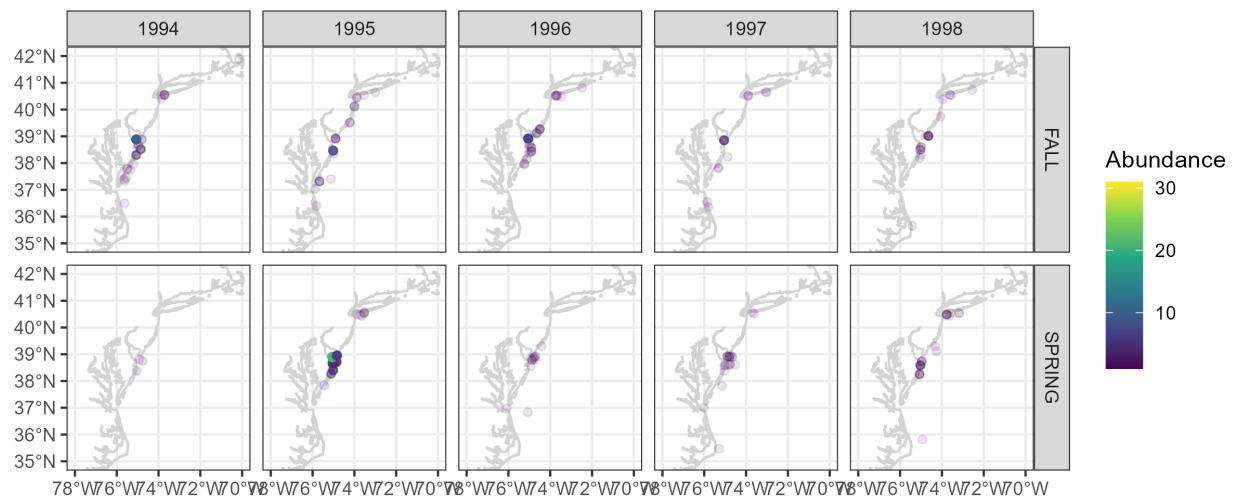

2021-02-15

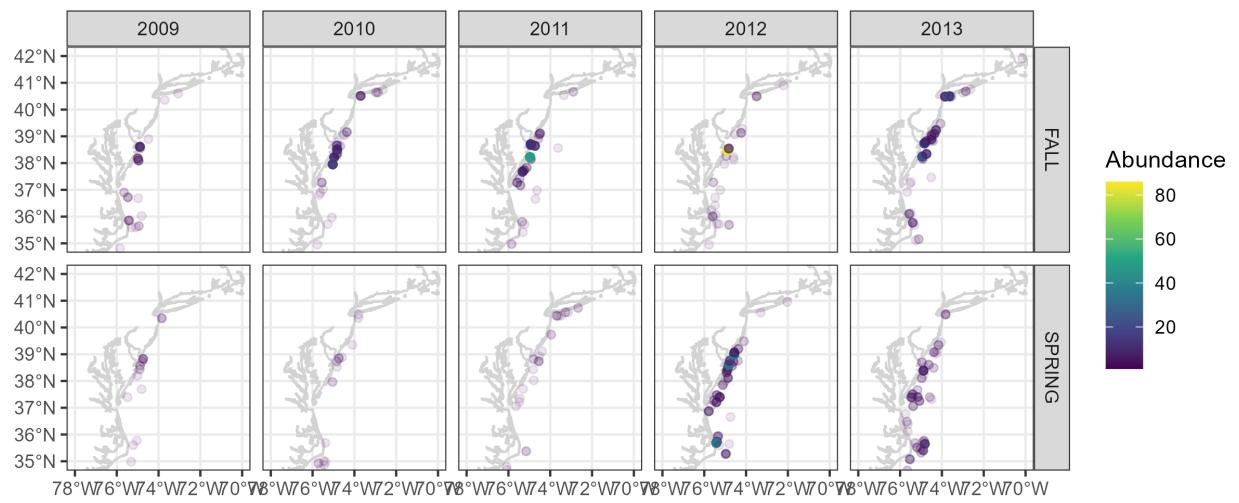

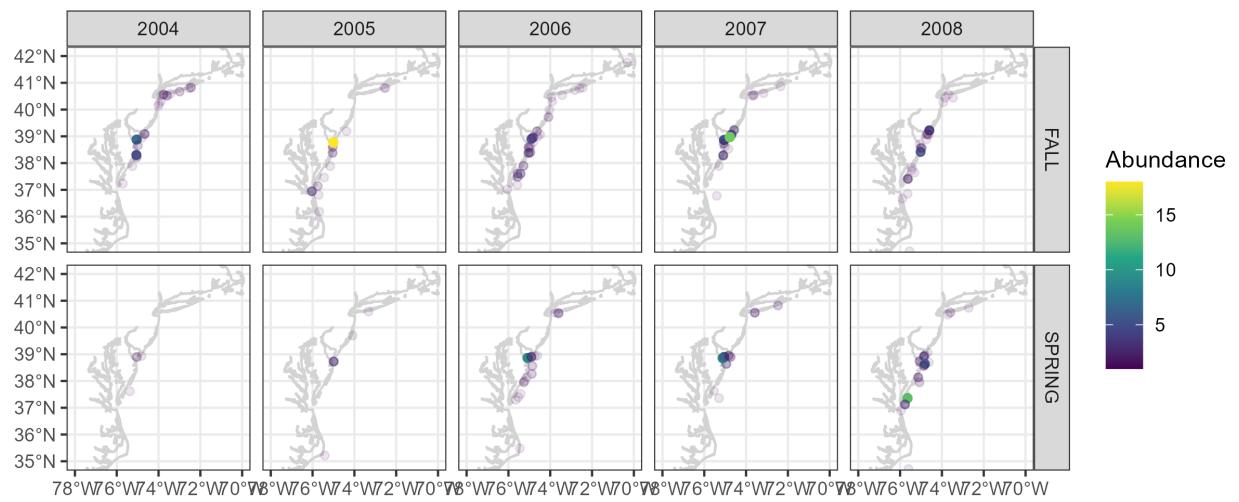

Data set runs from 1963 - 2019; horseshoe crab catch prior to 1969 was either not recorded or 0. Color and transparency are scaled by the corrected abundance or biomass: color runs from purple (low) to yellow (high), and transparency runs faint (low) to strong (high). Note that the color/transparency scale changes between each plot.

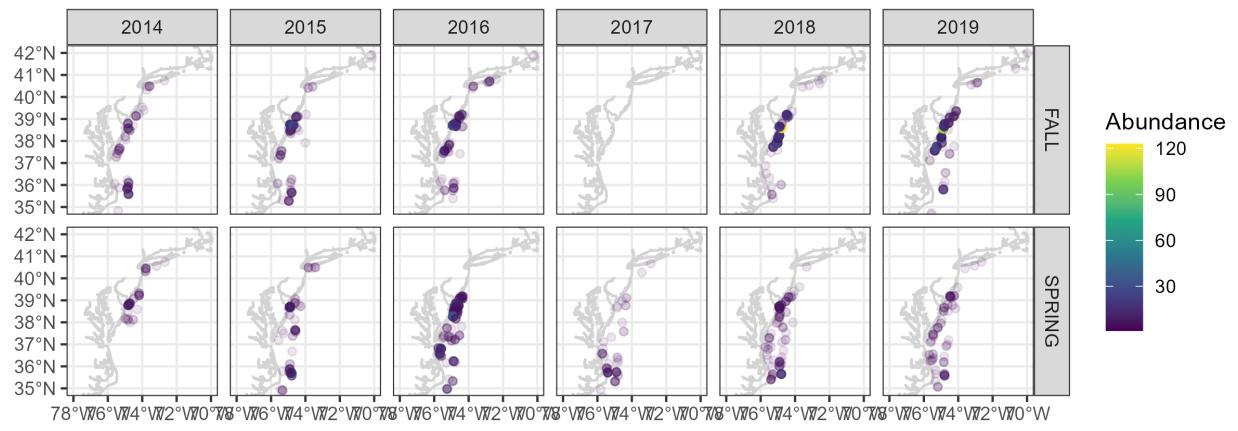

Abundance

Biomass
